Excerpt: .more layers of irregular interstitial cells intervene between the apices of the pear-shaped cells. The interstitial cells divide regularly by karyokinesis and are then crowded to the surface to replace the superficial cells that normally exfoliate. There are no glands in the bladder, but solid cell projections are sometimes found that resemble glands. The bladder is a part of the allantois, a vesicular evagination of the hind-gut. The bladder epithelium, therefore, is of hypodermic origin, while that of the ureter is from the mesoderm. A vascular submucosa intervenes between the mucosa and the muscular is. This is a thin layer of areolar tissue, but sufficient to give the mucosa apparent elasticity and enable it to move upon the muscular is. The muscular coat consists of smooth muscle fibers which may be divided into bundles of outer longitudinal fibers, a middle strong circular layer, and an...
